This clone is from an A. gambiae BAC library (ND-TAM) provided by FH. Collins and sequenced by The Institute for Genomic Research

F.H. Collins and sequenced by The Institute A: gambiae PEST strain

(TIGR). The BAC library was generated from A: gambiae PEST strain

(TIGR). The BAC library was generated from A: gambiae PEST strain

(TIGR). The BAC library was destracted from newly hatched first instar larvae

to minimize the inclusion of DNA from microorganisms that inhabit

the gut. The DNA is derived from mixed sexes of larvae. The BAC

library was constructed at Texas A&M Universty BAC Center

University, College Station, Texas 77843-2123, USA using a Hindili
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eukaryota; Metazoa; Arthropoda; Hexapoda; Insecta; Pterygota; Bukaryota; Metazoa; Arthropoda; Hexapoda; Insecta; Pterygota; Bukaryota; Diptera; Nematocera; Culicoldea; Culicidae; Anophelinae; Anophelinae; Anophelinae; Anophelinae; Anophelinae; Anophelinae; Anophelinae; Anophelinae; Anophelinae; Anopheliae; Hong,Y.S., Hogan,J.K., Wang,X., Sarkar,A., Sim,C., Loftus,B.J., Ren,C., Huff,E.R., Carlile,J.L., Black,K., Zhang,H.-B., Gardner,M.J. and Collina,F.H. Construction of a BAC library and generation of BAC end sequence-tagged connectors for genome sequencing of the African malaria mosquito Anopheles gambiae

/note="Vector: pCR 4-TOPO; This is an early neurogenesis
SSR library created by Mathew L. Rise constructed by
subtracting late neurogenesis (mixed stages: hindbrain
swelling + heart tube with peristalsis) from early
neurogenesis (mixed stages: neural groove + 1/2 epiboly).
Pish were from a domesticated strain (Spring Valley Trout
Parm, Langley, B.C.), courtesy of Bob Devlin, DFO. These
are mostly internal (coding) sequences."

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Gosegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo.

NY. The library is named RPCI-98 and was constructed by partial Econer Genetics at the Roswell Park Cancer Institute in Buffalo.

NY. The Library is named RPCI-98 and was constructed by partial BCORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2; cn bw sp, the same strain used for the BDGP's pland BCT library and how to order individual BAC clones, the entire library, and how to order individual BAC clones, the entire library, and how to order individual EACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           819

Soares (Genome Research, 6:79:1-806. 1996. First strand
containing a Not I site. Double stranded cDNA was ligated
to an EcoR I adaptor, digested with Not I, and cloned
directionally into pT7T3-Pac vector. The oligonucleotide
used to prime the synthesis of first-strand cDNA contains
a library tag sequence that is located between the Not I
site and the (dT)!B tail. The sequence tag for this

/dlone lib="Entamoeba histolytica Sheared DNA"
/dlone lib="better by Site_1: Bst 1; Constructed at The
Institute for Genomic Research (TIGR), Rockville, MD.
Genomic DNA isolated from broth cultures of E. histolytica
using a method described by Clark and Diamond (Clark,
C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a
method for isolate identification. Exp. Parasitol.
77:450.). The DNA was mechanically sheared to give a
tight size distribution (-2 kb). The v + i method used for
the library construction is described in detail in Smith,
H.O. and Venter, J.C. (Making small insert libraries for
whole genome shotgun sequencing projects. In Genome
Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barell, Oxford University Press, 1999)."

The invention relates to a Bacillus licheniformis mutant host cell derived from a parent B. licheniformis host cell. The mutant host cell is mutated in one or more genes encoding one or more polypeptides involved in sporulation. The host cell comprises one or more heterologous genes in sporulation. The host cell comprises one or more heterologous genes present in at least two copies, encoding one or more heterologous polypeptides. The heterologous genes are stably integrated into the genome of the cell without leaving any antibiotic resistance marker genes

at the site of integration. The heterologous genes are transcribed from a heterologous promoter or from an artificial promoter, and are comprised in an operon, preferably a polycistronic operon. The heterologous polypeptide is an antimicrobial peptide, or a fusion peptide comprising a poptide part which in its native form has antimicrobial activity. The heterologous polypeptide is an enzyme, preferably a secreted enzyme. The heterologous polypeptide is an enzyme, preferably a secreted enzyme. The enzyme of a class selected from the group of enzyme classes consisting of oxidoreductases (BC 1), transferases (BC 2), hydrolases (BC 3), lyasses (EC 4), isomerases (BC 5), and ligases (BC 6). The Bacillus licheniformis is useful in a process for producting at least one product of interest, comprising cultivating a B. licheniformis mutant host cell in a suitable medium, whereby the said product is produced. The process further comprises isolating or purifying the product of interest. The current sequence represents a B. licheniformis sporulation related polynucleotide

Disclosure; SEQ ID NO 123; 422pp; English.

This invention relates to a novel Bacillus licheniformis (B. licheniformis) mutant host cell derived from a parent B. licheniformis host cell that is mutated in genes encoding secreted polypeptides. Specifically, it refers to the generation of an improved Bacillus host that reduces the need for product purification caused by contaminant secreted native polypeptides in the culture medium. Accordingly, the present invention describes reducing the expression of these mative proteins (e.g. proteolytic enzymes, nutrient uptake factors and signal molecules), which in turn makes it easier to purify the heterologous product of interest and therefore improving the production process. Further benefits of a mutated host cell include an increase in total production yield and a longevity of shelf life attributable to improved product stability and purity. This polynucleotide is a DNA sequence
